

More stories. In your language.

A reader-first digital publisher for novels, comics, and manga. We license stories with unmet language demand, produce complete, human-reviewed editions, and sell them directly to readers.

A proposed business. Every figure in this deck is a planning assumption, not a validated forecast.

THE READER'S PROBLEM

Your next favorite story may already exist. Just not in a language you can comfortably read.

The customer is a reader who already buys digital fiction and can name the missing series, author, or subgenre. Not someone generally enthusiastic about AI.

THE MARKET THAT ALREADY PAYS

Germany already buys digital fiction. It does not yet buy from us.

37.2M

paid ebook purchases in the 2025
measurement

3.4M

buyers of paid ebooks

€7.01

average paid price; a €9.99 edition
must justify itself

88.2%

of ebook revenue is fiction

Units fell 4.5% in 2025 while revenue stayed flat. The thesis is better title selection and availability, not a market boom. These numbers establish an existing paid fiction market, not demand for a new store.

WHAT WE SELL

One complete, authorized, stable edition. Not an on-demand generation task.

With permission

Licensed from the creator or rights holder, who receives the agreed share of sales. Credits name the people behind the original and the edition.

Complete

Whole books, one-shots, or volumes with a clear continuation plan. No advertised series where only the first installment is contracted.

Voice intact

Consistent narrative voice, preserved ambiguity, reliable terminology, dialogue that still sounds like the characters. Full bilingual human review.

The production unit is **work × target language × approved edition**. The company invests once, maintains the published version, and earns every subsequent sale without regenerating the translation.

Six steps, one clear purchase

01	02	03	04	05	06
Discover	Sample	Understand	Buy	Receive	Next
Through a creator, a genre community, or a permitted campaign.	A substantial free sample opens without account friction.	Language, length, AI use, human review, credits, price, and access shown before purchase.	€7.99 to €9.99 per edition. No subscription, no credits, no upload.	The exact approved EPUB, tested reading instructions, a clear support route.	An available related title or sequel. Retention begins with another good story.

The page sells without AI in its headline, but production disclosures are visible before purchase. No social feed or recommendation engine is needed for this to work.

COMPETITION

The strongest competitor is an ordinary ebook already on sale

Alternative	What the record shows	What we must do differently
Amazon Kindle Translate	Invite-only beta, free during beta, limits on directly editing translated text	Independent editorial control and distribution. Model access alone is not differentiation.
BookTranslator.ai and similar	Advertise whole-book context and consistency workflows	Whole-book context is not a unique headline. Compete on delivered quality, authorization, and files.
J-Novel Club	Translated catalog, previews, individual purchases, memberships, series cadence	Learn from catalog identity and samples. A recognizable commercial mechanism, not proof of our margins.
Human localization agencies	Translation, lettering, page-level quality checking	Treat as suppliers, customers, or partners. Not merely competitors to replace.

Our position: a trusted home for stories that deserve another audience, supported by whole-work localization and accountable editorial production. A commitment to validate, not a claim competitors cannot match.

Product descriptions are first-party claims, not an independent ranking.

FIRST RELEASE

A broad destination, a narrow first release

Reader	One identifiable German-language adult-fantasy audience, marketed first in Germany
Language pair	English to German. One approved pair before any second language.
Format	Prose EPUB first. Illustrated stories activate through their own production gate.
Source	Rights-holder-supplied DOCX, one frozen revision, up to 120,000 source words
Review	Full bilingual review by a senior literary editor, planned at 50 hours per edition
Catalog	Up to three candidate editions from at least two rights holders. Funding reserved for two, released sequentially.
Expansion rule	Add the next title, format, or language only when rights, editorial capacity, reader demand, and contribution support it

THE REPEATABLE CYCLE

Each edition makes the next one cheaper to decide

- 1 Relevant reader demand and a compelling title
- 2 Available rights and a permitted sample
- 3 Scoped publishing agreement and production investment
- 4 Whole-work localization and human editorial approval
- 5 One stable, complete digital edition
- 6 Direct reader purchases and reliable delivery
- 7 A relevant next title, and a better-informed licensing decision

The advantage is cumulative.

A useful catalog, trusted editions, approved series knowledge, rights-holder relationships, and a reader audience that returns.

None of it arises from access to an inexpensive model. Each must improve the next production or purchasing decision.

From frozen source to royalty ledger, one durable workflow

A modular application, relational database, object store, and worker queue. This is a responsibility model, not a case for microservices. Hosted checkout can replace parts of it once its behavior is tested.

The system reads the whole book before it translates a line

Source facts

What is true in the text, with evidence and narrative timing

Model inferences

What the system believes after reading the whole work, kept separate and inspectable

Approved choices

Target-language decisions with scope, version, and an accountable approver

- Voices are stored as approved examples and specific decisions, not adjectives like "sarcastic"
- A recurring joke records setup, payoff, target-language choice, and rationale
- A revelation at the end may resolve an early ambiguity without being disclosed earlier than the original
- A changed glossary produces an impact list and proposed edits, never a blind rewrite
- Regeneration proposes changes; accepted human edits are never silently overwritten
- Series context is reused through explicit import and reconciliation. Glossary export is portable.

Five facts that stay separate in the schema

Work / Series

Original title, creators, source language, format, series order, rights-holder identity

RightsGrant

Exact edition, language, territories, formats, channels, term, exclusivity, processing permissions, evidence

SourceRevision

Immutable source hash, parser version, source-unit IDs, structure, original asset references

ContextRevision

Source-linked characters, terminology, voices, chronology, ambiguities, accepted decisions

TranslationUnit

Source mapping, dependencies, draft versions, configuration, cost, and state

EditionRevision

Accepted text, exported artifacts, credits, review record, release permission, rights reference

Offer / PriceSchedule

Edition, country, currency, tax classification, lawful price, access terms, effective dates

Order / Entitlement

Transaction, purchaser, exact edition, delivery permission, refund or withdrawal status, access scope

RoyaltyLedger

Contract version, calculation basis, reversals, advances, reserves, accruals, statements, payments

Demand, source possession, completed translation, editorial acceptance, and sale permission are five different records. No valid release permission means no sale, even when generation and export succeeded.

Six rules the code enforces, not the team

- | | |
|--|---|
| 01 Deliver stored approved files. A purchased edition is never regenerated at request time. | 02 Payment webhooks are idempotent. A repeated event never grants a duplicate purchase or a duplicate royalty accrual. |
| 03 Money runs on deterministic ledgers. Prices, VAT, refunds, royalties, and payouts are code. Model output never determines a payable amount. | 04 Corrections are versioned editions with an accountable decision and an update policy. Purchase history and entitlements survive file changes. |
| 05 Source material is untrusted data. A fictional command cannot authorize tool calls, publication, payments, network access, or disclosure of another project. | 06 Jobs are bounded and resumable. Explicit cancellation, spending caps that include in-flight work, escalation after a maximum repair count, intermediate artifacts stored. |

Every commercial state transition needs its evidence: license approved, budget authorized, review complete, offer approved, release authorized. A successful generation authorizes nothing.

A finished file is not a released product

Authorization

Rights chain covers processing, production, promotion, territory, format, channel, delivery

Source coverage

Every supported source unit accounted for. Unresolved omissions block release.

Editorial quality

Promised review completed, critical defects resolved, public review claims accurate

Format quality

Navigation, emphasis, metadata, accessibility checks, EPUBCheck, and real device routes tested

Commercial offer

Correct seller, price, VAT, territory, access terms, disclosures, and consent flow

Payment and delivery

A genuine order receives the correct edition. Failed and duplicate events behave safely.

Support

Delivery help, defect reports, withdrawal, refunds, corrections, and records operational

Reconciliation

Order, receipt, VAT, fees, reversals, royalty accrual, and cash movements reconcile

Licensing, editorial scheduling, approvals, and royalty statements may stay manual at launch. Manual work is a legitimate launch mechanism. Hidden manual work is an economic error.

Measure the edition the reader receives, and the draft separately

What is scored

Fidelity	Serious mistranslations, omissions, invented content, distorted characterization
Continuity	Names, terminology, chronology, voice, motifs across distant passages
Literary reading	Dialogue, register, rhythm, ambiguity, narrative comfort
Checker usefulness	Consequential defects found, false positives, review time
Labor	Translation, editing, QA, onboarding, support, and all rework
Reader outcome	Delivery problems, defects, refunds, enjoyment, subsequent purchases

How it is scored

- Paid bilingual assessors, a second reviewer on sampled or disputed judgments
- Workflow identity blinded, assignments counterbalanced
- MQM error categories and severities, with a literary protocol defined for this product
- The work is the unit of uncertainty, not thousands of correlated paragraphs
- Ablations isolate local, whole-work, and structured memory on the same model

30 to 50% less editorial effort

is the target to investigate against a strong baseline, with no worse serious-error outcomes. Not promised before measurement.

What one retained copy leaves behind

Per retained paid copy	EUR
Consumer price, 7% VAT included	9.99
Sales excluding VAT	9.34
Rights-holder royalty, 30% of ex-VAT	-2.80
Payment allowance	-0.45
Delivery, support, residual refunds	-0.60
Contribution before acquisition	5.49
Acquisition allocation per sale	-2.00
Contribution toward production and overhead	3.49

861

retained copies recover one €3,000 edition, before company overhead

The €3,000 edition

Bilingual review 50 h × €45 = €2,250 · inference and infrastructure €60 · formatting and QA €180 · cover and metadata €200 · launch prep €160 · contingency €150

SENSITIVITIES

Acquisition cost moves the answer more than price does

Change, other assumptions held	Contribution	Copies to recover €3,000
€0.50 acquisition per sale	€4.99	602
€2.00 acquisition per sale (base)	€3.49	861
€5.00 acquisition per sale	€0.49	6,180
€8.99 price, €2 acquisition	€2.83	1,060
€7.99 price, €2 acquisition	€2.18	1,378
Review doubled to 100 hours	€3.49	1,507

Title outcome after €3,000, before overhead	
100 copies	-€2,651
500 copies	-€1,257
1,000 copies	+€486
2,000 copies	+€3,971

Learning gates come first: 10 genuine purchases to test operations, then 50 to 100 retained purchases to read demand. At 3% conversion, 861 copies need roughly 28,700 qualified visits. This is arithmetic, not a benchmark.

One edition, sold through a real channel, by week twelve

Weeks 1–2

Readers. 30 target-language reader interviews; define the catalog promise and discovery routes.

Rights. Qualify 10 to 15 rights holders; reviewer quotes; shortlist up to three editions.

Product. Source preflight, title-page prototype, rights and evidence records.

Weeks 3–4

Readers. Test permitted samples and price presentation; identify a credible first audience.

Rights. Negotiate the first license; freeze source, review scope, sample style, and budget.

Product. Durable production stages, whole-work context, protected edits, cost tracking.

Weeks 5–8

Readers. Prepare the launch channel and the support process.

Rights. Complete the first edition and full review; obtain approvals; start a second only within reserved capacity.

Product. EPUB export, accessible purchase and refund flow, entitlement and ledger tests.

Weeks 9–12

Readers. Sell the first edition; analyze channel costs and support; offer the next release when ready.

Rights. Review actual economics; decide the second and third commitment.

Product. Fix observed failures, document release operations, measure repeat purchases.

A proposed sequence, not a promised release date. Rights negotiations, editorial capacity, and sample findings set the timing.

NINETY-DAY ALLOCATION

€49,000 to reach the first independent purchase

€25,000 discretionary validation

Two prose editions at €3,000	€6,000
Publishing, consumer, and tax advice	€5,000
Reader research and independent assessment	€3,000
Storefront, delivery, accessibility testing	€2,000
Target-language acquisition experiments	€3,000
Contingency and uncommitted third-edition reserve	€6,000

€24,000 · three months of shared operations

Founder compensation allocation	€4,000 / mo
Fractional product and frontend capacity	€2,000 / mo
Recurring product and domain evaluation	€1,000 / mo
Administration, security, bookkeeping, tools	€1,000 / mo

Capital is released in stages: rights discussions and paid samples first, then the first production budget and minimum commerce, then the second edition only in light of the first title's evidence.

Four risks, each with a signal we watch and a specific response

Risk	Early signal	Response
Demand is too fragmented	Many requested titles, few buyers for any one edition	Concentrate the readership and license coherent clusters
Fluent text conceals errors	Bilingual assessment finds omissions or changed plot details	Preserve source mappings, targeted checks, and complete review
Acquisition consumes contribution	Sales disappear when paid promotion stops	Improve title and channel fit, measure all acquisition work, test repeats
Sequel access fails	Readers cannot buy the next installment	Secure bounded sequel arrangements before making continuity the promise

A weak title does not disprove the production engine. An excellent translation does not prove demand. Title selection, audience reach, price, quality, delivery, and unit economics are judged separately.

THE NEXT CONCRETE STEP

Translate with context.
Publish with permission.
Earn the reader's next purchase.

A shortlist of real reader gaps
and rights-controlling partners

Permissioned samples and paid
editorial assessment

One scoped first agreement, one
finished edition

One sale through a real
acquisition route, then the next
title
